

Project Quality Management. PM Series - 10 | by Vivek Tiwari | Medium

By Vivek Tiwari

Quality Management — Executing Phase Manage Quality The main focus of this process is to execute the plan that the project manager and team have created to meet the quality standards for the product or service. The critical outputs of this process are Quality Reports— that include information about quality issues with the project, and recommendation on the improvement of the current process Test and Evaluation Documents— A checklist used by Quality Assurance teams to measure the quality standards of a product. How do we achieve the desired output? First, consider analyzing the Quality Management Plan (QMP) which provides information about the quality standards, objectives, control, and assurance procedures. In addition to the QMP, project documents such as the Lessons Learned Register, Quality Metrics, and Risk Report should also be reviewed. These documents provide information on recommended methods for improving quality, metrics used to measure quality, and risks that should be taken into consideration. In addition to the common ITTOs, consider the below tools as critical to be applied to the above-mentioned inputs Under the data-gathering process, checklists play a critical role in helping QA team members review the essential components of the product and ensure that the quality standards specified in the checklists are met. Under the data-representation process, the cause-and-effect diagram is vital which helps the team to identify the cause of the defect. Quality audits are essential as they ensure that best practices are being followed and enable the sharing of important audit metrics with stakeholders, keeping them informed about the end product. Design for X — that developers use to design a specific part of the product. By utilizing the above-mentioned processes, standardized quality can be achieved through effective actions.
